General Notes

- Windows: if you want to use the Mining Difficulty feature, you must allocate more memory to your program (see Mining Difficulty). If you have lots of RAM, try allocating 256Mb or 1024Mb - likely you need only 128Mb for your program.
- **More CPU power will make things go faster for host and clients** -
  e.g. if you have a 1.5GHz P4, you might get ~78 KHS per second.
- **Set the clients to not start if they can't get into the Elden Ring network**
- When using the Mining Difficulty feature, additionally clients must fork in order to be actively mining. To add this, use:
  myprogram -playepg:ws --fork --before=N where N is the number of seconds since the last "Leave" event for the session. When a session abandons, this number drops dramatically.
- You are allocating a lot of memory while forking, so not very very large instance sizes work well when using this method.
- If you get unbounded memory usage, check the latest release

  Try this:

GAME OVERVIEW When you're a young, fourteen-year-old orphan, an accident leaves you critically injured. The only hint of what caused this accident is a cloud of swirling mist that now envelops your body. You're rushed to an infirmary in eastern Shalan, where surgeons attempt to save your life, but it's a hopeless endeavor. In the end, all they're able to do is turn your life into a living death. THE HERO'S REFLECTION Five months later, you awake to find yourself in the body of a warrior. The only thing that can explain this is the promise that your dead body made to you at the moment of your death: to become the warrior of the Lands Between. At this point in the story, only a handful of actual characters have been introduced to you, and they are shown to belong to the protagonist, Black Dragon. At first, all you know about the hero of the Lands Between is that he's an orphaned warrior who was born with the power of flight. The only way to discover his full identity is to satisfy the promise he made as a spirit: to become an "Elden Lord." Systemic lupus erythematosus (SLE) is an autoimmune disease with multi-organ involvement. One of the complications is hypertrophic osteoarthropathy (HOA), a syndrome characterized by clubbing of the digits, periostosis, and thickened skin. It occurs in 60-85% of SLE patients and usually begins in young people and presents in two phases, the earlier acute phase and the later chronic phase. It can precede lupus nephritis by weeks or years. In the acute phase, patients have fever, arthralgia, and pleurisy. In the chronic phase, patients exhibit joint swelling, joint tenderness, and edema of the eyelids and/or face. The pathogenesis of HOA remains unclear, although some studies support a role for interleukin-1 and tumor necrosis factor-alpha, both cytokines associated with both SLE and HOA.Q: Why would you not use a product in a new software project? Even if the project is a single software module and doesn't need to be constantly revised, using a product from years past is usually considered a bad idea: Version control systems such as git or subversion should be used, because they allow you to easily back out and revert to an older version of the code when something goes wrong.
